

Sathero Master Satellite / Transponder List

xls files contain our extensive list of all known satellites and transponders formatted for the Sathero meter meters and other meters. You only need to modify our master list to make it your own personalized list.

This is very straight forward and easy to do. Just open the list in your favorite editor and delete the rows containing the satellites you don't need. If you delete a satellite, delete all the transponders under that satellite. Delete entire rows. Never delete part of a row or your finished list will not work. Do not leave blank rows in your new list.

Once you have pared down the list to the satellites you want to keep, delete the the transponders that you don't need under each satellite. The smaller the list the quicker it will load to the meter and the faster the meter will operate.

Pay attention to the LNBF LO frequencies and make sure they match the LNBF you will be using. If they don't match, change them.

Load your new list to your meter and you are ready to use it.

Note: Your list should not be very big. Each satellite should have only 1 or 2 transponders per band. You can easily keep every satellite viewable from your location and 2 transponders (4 if you have both C and Ku) and it will still be small enough.

Editors you can use to modify .xls files:

- [OpenOffice Calc](#) (free)
- [LibreOffice Calc](#) (free)
- [Microsoft Office Excel](#) (\$\$\$)
